Fermilab

Mu2e Physics Motivation

- Mu2e will measure Charged Lepton Flavor Violation (CLFV) with a single-event sensitivity of 2×10^{-17}

$$\mu^- N \rightarrow e^- N$$

- This experiment

  - Offers compelling discovery sensitivity over broad array of Beyond the Standard Model (BSM) parameter space

  - Provides unique and incisive probe of BSM physics

  - Has the world's best sensitivity to CLFV

🎯 Fermilab

Some CLFV Processes

Process	Current Limit	Next Generation exp
$\tau \longrightarrow \mu\eta$	BR < 6.5 E-8	
$\tau \longrightarrow \mu\gamma$	BR < 6.8 E-8	$10^{-9} - 10^{-10}$ (Belle II)
$\tau \longrightarrow \mu\mu\mu$	BR < 3.2 E-8	
$\tau \longrightarrow eee$	BR < 3.6 E-8	
$K_L \longrightarrow e\mu$	BR < 4.7 E-12	
$K^+ \longrightarrow \pi^+ e^- \mu^+$	BR < 1.3 E-11	NA62
$B^0 \longrightarrow e\mu$	BR < 7.8 E-8	Belle II, LHCb
$B^+ \longrightarrow K^+ e\mu$	BR < 9.1 E-8	
$\mu^+ \longrightarrow e^+\gamma$	BR < 5.7 E-13	10^{-14} (MEG)
$\mu^+ \longrightarrow e^+ e^+ e^-$	BR < 1.0 E-12	10^{-16} (PSI)
$\mu N \longrightarrow eN$	$R_{\mu e}$ < 7.0 E-13	10^{-17} (Mu2e, COMET)

- The most sensitive CLFV probes use muons

Doug Glenzinski , Fermilab PAC, Jan 22-24 2014

‡ Fermilab

How does Mu2e work?

Doug Glenzinski , Fermilab PAC, Jan 22-24 2014

🟦 Fermilab

Mu2e Concept

- ## Generate a beam of low momentum muons
  - Use 8 GeV protons from existing Fermilab complex

- ## Stop the muons in orbit around a nucleus
  - We plan to use aluminum stopping target
  - In orbit around aluminum τ_μ^{Al} = 864 ns
  - Important in discriminating background

- ## Look for events consistent with the signal

Doug Glenzinski , Fermilab PAC, Jan 22-24 2014

🎗 **Fermilab**

Mu2e Concept

- Proton pulse on Production target
- Muons at Stopping target (red)
- 1700 ns
- 700 ns
- 900 ns
- Live Window
- Time (ns)

- Mu2e will use a pulsed proton beam and a delayed live gate to suppress prompt background

Doug Glenzinski , Fermilab PAC, Jan 22-24 2014

🟦 **Fermilab**

Mu2e Concept

- ## Generate a beam of low momentum muons

  - Use 8 GeV protons from existing Fermilab complex

- ## Stop the muons in orbit around a nucleus

  - We plan to use aluminum stopping target
  - In orbit around aluminum τ_μ^{Al} = 864 ns
  - Important in discriminating background

- ## Look for events consistent with the signal

Doug Glenzinski , Fermilab PAC, Jan 22-24 2014

Fermilab

Mu2e Signal

- ## The process is coherent

  - ### The nucleus is left intact

- ## Experimental signature is an electron and nothing else

  - Energy of electron : $E_e = m_\mu - E_{recoil} - E_{1S\text{-}B.E.}$
  - For aluminum: $E_e = 104.96$ MeV
  - Important for discriminating background

🐝 **Fermilab**

Mu2e Background

Category	Source	Events
Intrinsic	μ Decay in Orbit	0.22
	Radiative μ Capture	<0.01
Late Arriving	Radiative π Capture	0.03
	Beam electrons	<0.01
	μ Decay in Flight	0.01
	π Decay in Flight	<0.01
Miscellaneous	Anti-proton induced	0.10
	Cosmic Ray induced	0.05
	Pat. Recognition Errors	<0.01
Total Background		0.41

(assuming 6E17 stopped muons in 6E7 s of beam time)

- Discovery sensitivity accomplished by suppressing backgrounds to <1 event total

Doug Glenzinski , Fermilab PAC, Jan 22-24 2014

‡ Fermilab

Mu2e Scope and Schedule

Mu2e Scope

- Beam line capable of delivering 8kW of 8 GeV protons with the necessary time structure

- Experimental apparatus capable of
  - capturing low momentum muons
  - Delivering muons to the stopping target
  - Measuring high energy electrons originating from the stopping target

- An experimental hall to house the experiment

Doug Glenzinski , Fermilab PAC, Jan 22-24 2014

🟦 **Fermilab**

Mu2e Proton Beam

- Mu2e uses 8 GeV protons from Booster

- Mu2e and (g-2) will repurpose much of the Tevatron anti-proton complex to instead deliver muons.

- Mu2e can (and will) run simultaneously with NOvA.

Doug Glenzinski , Fermilab PAC, Jan 22-24 2014
🔆 **Fermilab**

Mitigating Out-Of-Time Protons

- The RF structure of the Recycler provides some "internal" extinction:

  - Extinction (Intrinsic) = few 10^{-5}

- A custom-made AC dipole placed just upstream of the production target provides additional "external" extinction:

  - Extinction (AC dipole) = $10^{-6} - 10^{-7}$

- Together they provide a total extinction:

  - Extinction (Total) = few $10^{-11} - 10^{-12}$

Doug Glenzinski , Fermilab PAC, Jan 22-24 2014

# Mu2e Recent Progress : Conductor R&D

- Our solenoids require four different conductors

  - Production solenoid (PS)

  - Transport solenoid (TS)

  - Detector solenoid x2 (DS-1, DS-2)

- To produce conductor, 3 main steps

  - Superconducting strand

  - Rutherford cable

  - Extruded superconductor

- Awarded contracts to vendors in early 2013 to produce R&D quantities of each conductor

Doug Glenzinski , Fermilab PAC, Jan 22-24 2014

‡ **Fermilab**

Mu2e Recent Progress : Conductor R&D

- Vendors making excellent progress.

- Conductor R&D campaign nearly complete.

- We expect to be in a position to place Production orders in March 2014 – maintains technically limited schedule.

| Conductor Type	Strand	Cable	Final extrusion	Shipped
PS	meets spec	meets spec	meets spec	17 Jan
TS	meets spec	meets spec	meets spec	here
DS-1	meets spec	meets spec	meets spec	17 Jan
DS-2	meets spec	meets spec	meets spec	25 Jan

Mu2e Recent Progress : Test Beams

- Test beam efforts for Cosmic-Ray Veto and Extinction Monitor systems completed in September at Fermilab.

- Joint US-Japan effort to measure products of muon capture on aluminum (AlCap) completed Run-1 in December at PSI.

- Calorimeter test beam scheduled for February to test different crystals and photo-sensors.

- Variety of radiation hardness tests.

Doug Glenzinski , Fermilab PAC, Jan 22-24 2014

🛠 Fermilab

Test Beam – September 2013
- Cosmic Ray Veto – SiPM, WLS, and component prototype tests
- Upstream Extinction Monitor – conceptual demonstration

Doug Glenzinski , Fermilab PAC, Jan 22-24 2014
춘 Fermilab

Test Beam – September 2013 Results

Typical light yield from CRV counter prototype – 20 cm from RO end
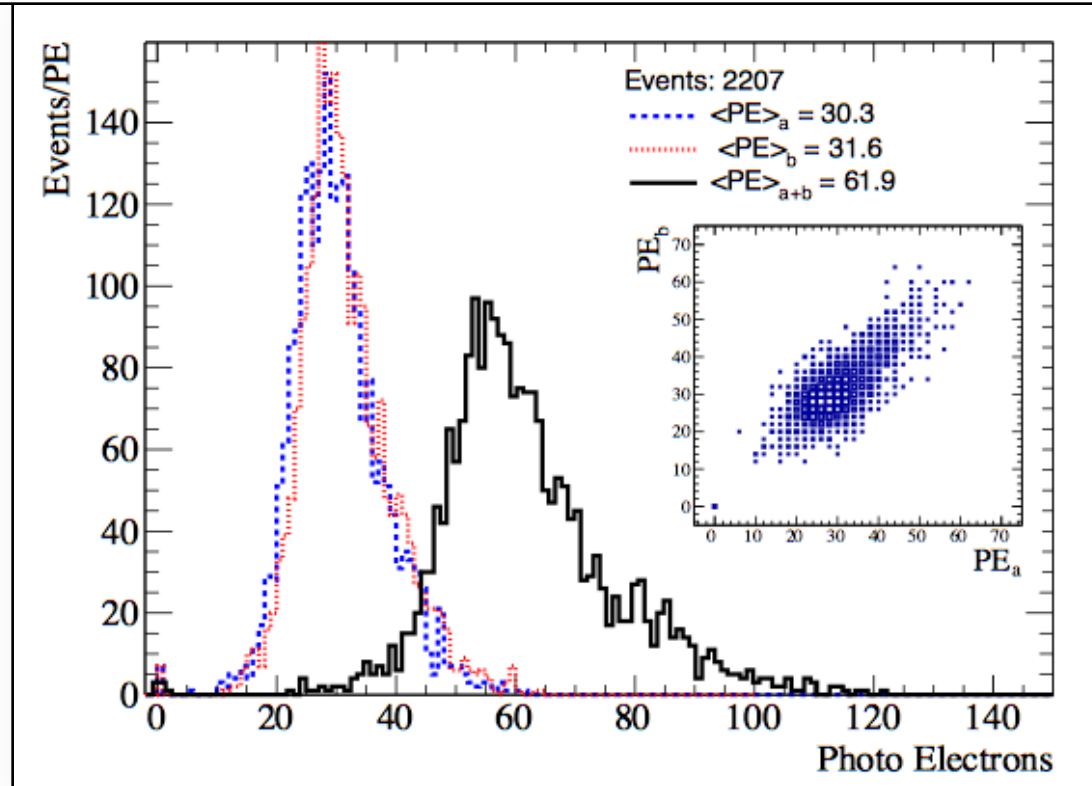

- Achieves veto efficiency >99% at 2.5m from RO
  - want more light to allow for SiPM failure, 8y lifetime
  - will move from 1mm WLS fiber to 1.4 mm

🔷 **Fermilab**

Test Beam – December 2013

- AlCap – measurement of products of muon captures on aluminum
  - Joint Mu2e/COMET effort
  - Took data at PSI 26Nov – 23Dec

Mu2e Challenges

Doug Glenzinski , Fermilab PAC, Jan 22-24 2014

춘 Fermilab

Mu2e Challenges

- ## Place conductor orders
  - On track for CD-3a review in March

- ## Initiate solenoid design/build bid process
  - Aim to put bids on the street this week

- ## Finish preparations for CD-2/3 review
  - Aim to have review in 2nd half of FY2014

- ## Determine viability of radiatively cooled W production target
  - Ongoing R&D at RAL
  - Potential oxidation issues if pressure > 1e-6 mbar
  - Fall-back, water-cooled target ($+1M)

Doug Glenzinski , Fermilab PAC, Jan 22-24 2014

⚛ Fermilab

In Closing

**Doug Glenzinski , Fermilab PAC, Jan 22-24 2014**

🔆 Fermilab

Conclusions

- Mu2e offers compelling discovery sensitivity across a broad swath of BSM parameter space.
    - A unique incisive probe of BSM physics

- Solenoid designs mature
    - Conductor R&D program successful
    - PS, DS solicitation packages on the street in Jan.

- Significant progress in defining design of the baseline apparatus – will be ready for CD-2/3 in 2nd half of FY2014.

- Building design complete – ready to break ground in Fall 2014.

Doug Glenzinski , Fermilab PAC, Jan 22-24 2014

Mu2e attracts magnet experts

By tapping into specialized knowledge around the world, the Mu2e collaboration will undertake a first-of-its-kind experiment.

Mu2e experiment

Fermilab's Mu2e experiment is unlike anything ever attempted. So when the collaboration needed a first-of-its-kind magnet prototype built, they turned to an institution known for its magnet expertise: the Genoa section of the Italian Institute for Nuclear Physics, or INFN, located in the University of Genoa in Italy.

Earlier this year, INFN-Genoa became the sixth Italian institution to join the Mu2e collaboration, which now sports more than 150 members from 28 labs and universities in the United States, Italy and Russia. The team of magnet experts there has decades of experience working on high-energy physics experiments—they helped design and build magnets for BaBar at SLAC and, more recently, the CMS detector at CERN.

Now they're putting that knowledge toward building prototypes of the years-in-development magnets that will be used for for Mu2e, an experiment intended to study whether charged particles called leptons can change from one type to another. According to Doug Glenzinzki, the deputy project manager for Mu2e, the experiment's goal is to narrow down the possibilities for completing physicists' picture of the universe, by amassing evidence for one theory over others.

"We know the Standard Model is incomplete," Glenzinski says. "The number one goal of particle physics is to elucidate what a more complete model looks like. There are a lot of theories, and we are looking for data that tells us which is right."

It turns out, Glenzinski says, "charged lepton flavor violation"—the phenomenon Mu2e is being built to study—is a powerful way of
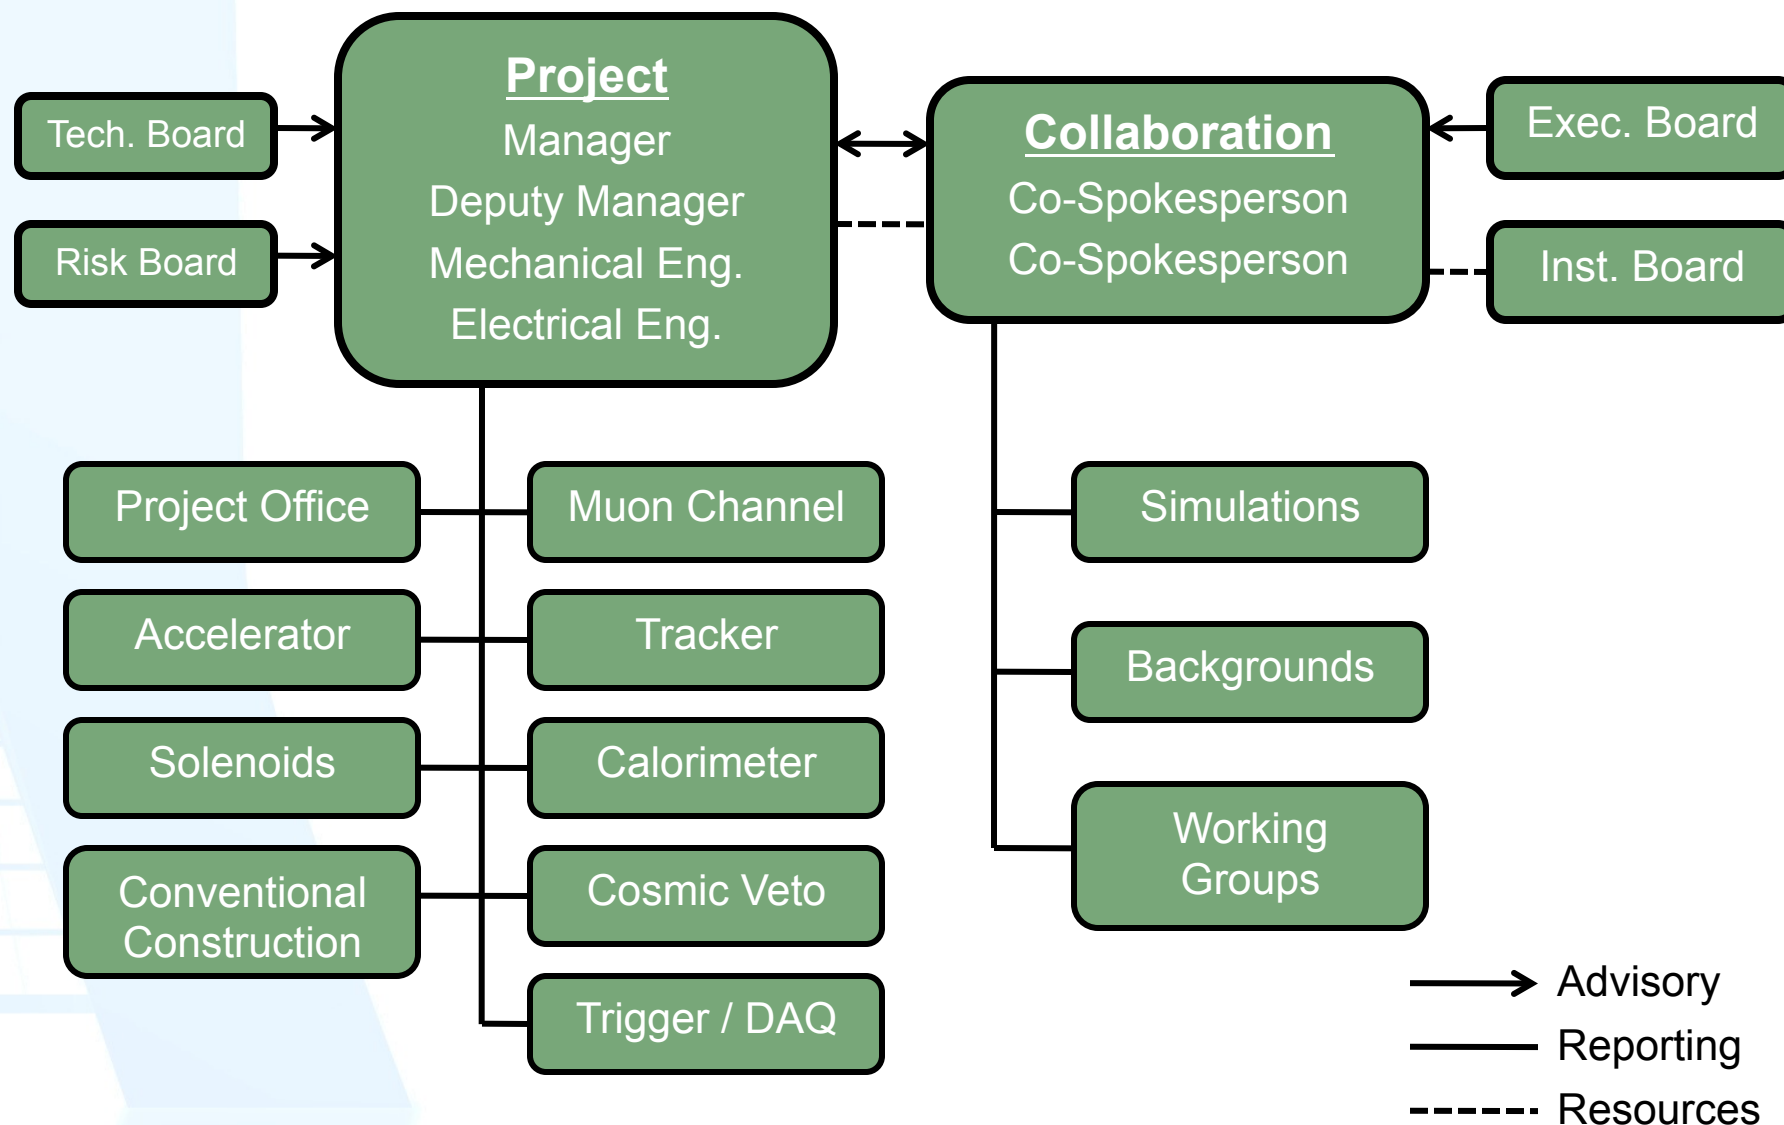

Toward better beam extraction
New projects bring to Fermilab new technological challenges and new solutions. One of those new technologies is the electrostatic septum made with very thin tungsten foils. Electrostatic septa are used in slow beam extraction to separate the circulating and extracted beams. At Fermilab, slow extraction has traditionally taken place as the beam is sent from the Main Injector to the Switchyard. In the standard technology, the septum plane is made as a layer of 100-micrometer tungsten wires. A challenge of the Mu2e project is slow extraction of protons with

🐭 Fermilab

Mu2e Dominant Background Sources

- ## Decay-in-Orbit (DIO)

 - Intrinsic physics background from stopped muons decaying while in orbit around Al nucleus
Electron energy in MeV

- ## Requires an excellent spectrometer resolution with small non-Gaussian tails

‡ Fermilab

Mu2e Dominant Background Sources

- Radiative pion Capture (RPC)
  - Pions at Al target are promptly captured on nucleus
  - About 2% of the time a photon is radiated with a maximum energy ~ M_π
  - Main sources of pions at stopping target t >700 ns
    - Tails in proton distribution
    - Out-of-time protons
    - Anti-protons annihilating near Al target

- Requires narrow proton pulses, suppression of out-of-time protons, anti-proton absorber

Doug Glenzinski , Fermilab PAC, Jan 22-24 2014

🔷 **Fermilab**

Mu2e Pulsed Proton Beam

- Mu2e will use a pulsed proton beam and a delayed live gate to suppress prompt background

Doug Glenzinski , Fermilab PAC, Jan 22-24 2014

🔷 Fermilab

Mu2e Dominant Background Sources

Doug Glenzinski , Fermilab PAC, Jan 22-24 2014

‡ Fermilab

Mu2e Dominant Background Sources

- ## Cosmic-Ray Induced

  - CR can create background events via scattering, decay, or material interactions

  - Get about one such event per day
- ## Requires high efficiency CR-veto system, PID

**Doug Glenzinski , Fermilab PAC, Jan 22-24 2014**

🔷 **Fermilab**

The Mu2e Tracker

- ## Will employ straw technology

  - Low mass
  - Can reliably operate in vacuum
  - Robust against single-wire failures

- 5 mm diameter straw
- Spiral wound
- Walls: 12 μm Mylar + 3 μm epoxy
  + 200 Å Au + 500 Å Al
- 25 μm Au-plated W sense wire
- 33 – 117 cm in length
- 80/20 Ar/CO_2 with HV < 1500 V

‡ Fermilab

The Mu2e Tracker

plane   station

- Self-supporting "panel" consists of 100 straws
- 6 panels assembled to make a "plane"
- 2 planes assembled to make a "station"
- Rotation of panels and planes improves stereo information
- 22k straws total

Fermilab

The Mu2e Tracker

- 18 "stations" with straws transverse to beam
- Naturally moves readout and support to large radii, out of active volume

3 meters

🎇 Fermilab

Mu2e Pattern Recognition
- A signal electron together with all the other "stuff" occurring simultaneously integrated over 500-1695 ns window

Doug Glenzinski , Fermilab PAC, Jan 22-24 2014

**🔷 Fermilab**

Mu2e Pattern Recognition

(particles with hits within +/-50 ns of signal electron t_{mean})

- We use timing information to look in +/- 50 ns windows – significant reduction in occupancy and significant simplification for Patt. Rec.

Doug Glenzinski , Fermilab PAC, Jan 22-24 2014
‡ Fermilab

Mu2e Spectrometer Performance

Tracker Momentum Resolution

Core Width = 92 KeV/c

High Tail Slope = 134 KeV/c

High Tail Fraction = 1.4 %

Reco×Selection Efficiency = 83 %

- Performance well within physics requirements

Doug Glenzinski , Fermilab PAC, Jan 22-24 2014

🔷 **Fermilab**

After all analysis requirements

Reconstructed e⁻ Momentum

- Single-event-sensitivity = 2×10^{-17}
- Total background < 0.5 events

Doug Glenzinski , Fermilab PAC, Jan 22-24 2014

‡ Fermilab

Reconstruction and Selection Efficiencies

for signal electrons
- Inefficiency dominated by geometric acceptance and delayed signal-timing window

Doug Glenzinski , Fermilab PAC, Jan 22-24 2014

‡ Fermilab

Mu2e Performance
- Robust against increases in rate

Doug Glenzinski , Fermilab PAC, Jan 22-24 2014

⚛ Fermilab

Mu2e Calorimeter

- Crystal calorimeter
  - Compact
  - Radiation hard
  - Good timing and energy resolution

Doug Glenzinski , Fermilab PAC, Jan 22-24 2014

‡ Fermilab

Mu2e Calorimeter

- Baseline design : Lutetium-yttrium oxyorthosilicate (LYSO)
  - Radiation hard, non-hygroscopic

|	LYSO
Density (g/cm3)	7.28
Radiation length (cm)	1.14
Moliere Radius (cm)	2.07
Interaction length (cm)	20.9
dE/dX (MeV/cm)	10.0
Refractive index	1.82
Peak luminescence (nm)	402
Decay time (ns)	40
Light yield (rel. to NaI)	85%
Variation with temperature	-0.2% / deg-C

Doug Glenzinski , Fermilab PAC, Jan 22-24 2014

≢ Fermilab

Mu2e Calorimeter

Disk 1   Disk 2
- Will employ 2 disks (radius = 36-70 cm)
- 2640 crystals with hexagonal cross-section
  - 3 cm diameter, 11 cm long (9.6 X_0)
- Two photo-sensors/crystal on back (APDs or SiPMs)

‡ Fermilab

Mu2e Calorimeter
- ## With 40 ns hit separation, expect to achieve an energy resolution <5% for 105 MeV electrons
  - Performance stable with reasonable variations of accidental rate

Doug Glenzinski , Fermilab PAC, Jan 22-24 2014

Mu2e Cost Breakdown
- Solenoid costs : Coils/Infrastructure ~ 65/35

Doug Glenzinski , Fermilab PAC, Jan 22-24 2014

Mu2e CD-2/3 Preparations

- ## Project

  - Preparing RLS and supporting documentation for 27 February briefing with DOE

  - Preparing draft TDR chapters for ~April Director's review in preparation for DOE review

- ## Collaboration

  - Performing sensitivity studies for the baseline apparatus

  - Preparing draft TDR chapter describing these studies and summarizing physics of experiment

Doug Glenzinski , Fermilab PAC, Jan 22-24 2014

🐝 Fermilab

Mu2e Sensitivity for TDR

- ## Background Working Group

  - Established March 2013
    (led by A. Gaponenko, FNAL WF)
  - Significant contributions from collaboration
    (D. Brown (LBNL), R. Ehrlich (U. Virginia),
    K. Knoepfel (FNAL), R. Kutchke (FNAL),
    Z. You (UC Irvine))

- ## Staged approach

  - Factorizes work and facilitates detector optimizations and systematic studies
  - 2600M POT generated $\rightarrow$ 1M micro-pulses
  - 3×10^5 CPU-days, 10 TB of disk

- ## Studies ongoing, documentation in preparation
